Project Issue Communication - Managing Application for Projects

Username

userName, string

Password

password, string

verifyCredentials()
userHomeScreen.html

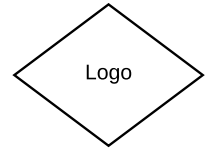

recoverCredentials()

registration.html

I'm thinking this can ask user to input email. Send the username and password (later can be more secure). Pop up verification that email was sent.

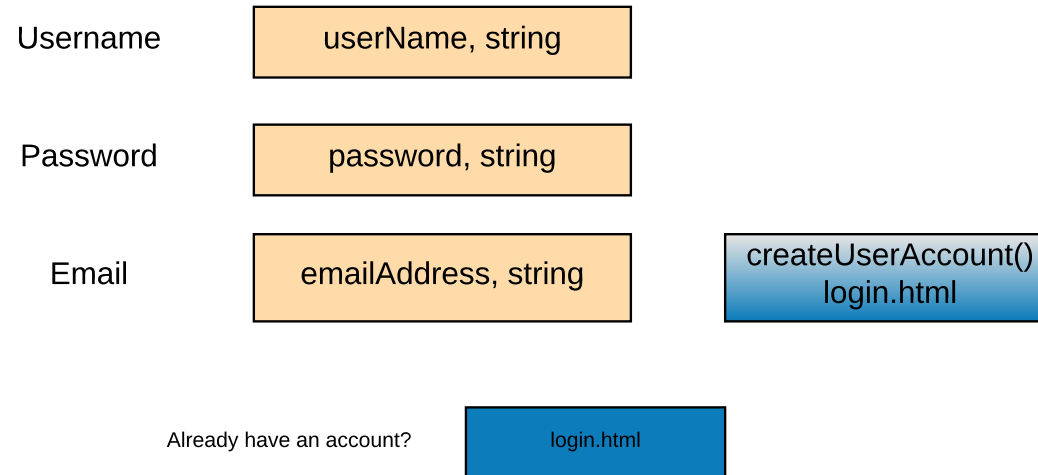

orange = user inputs
gray = buttons
blue = hyperlinks
pink = function call

pink = function call

userName
logout() login.html

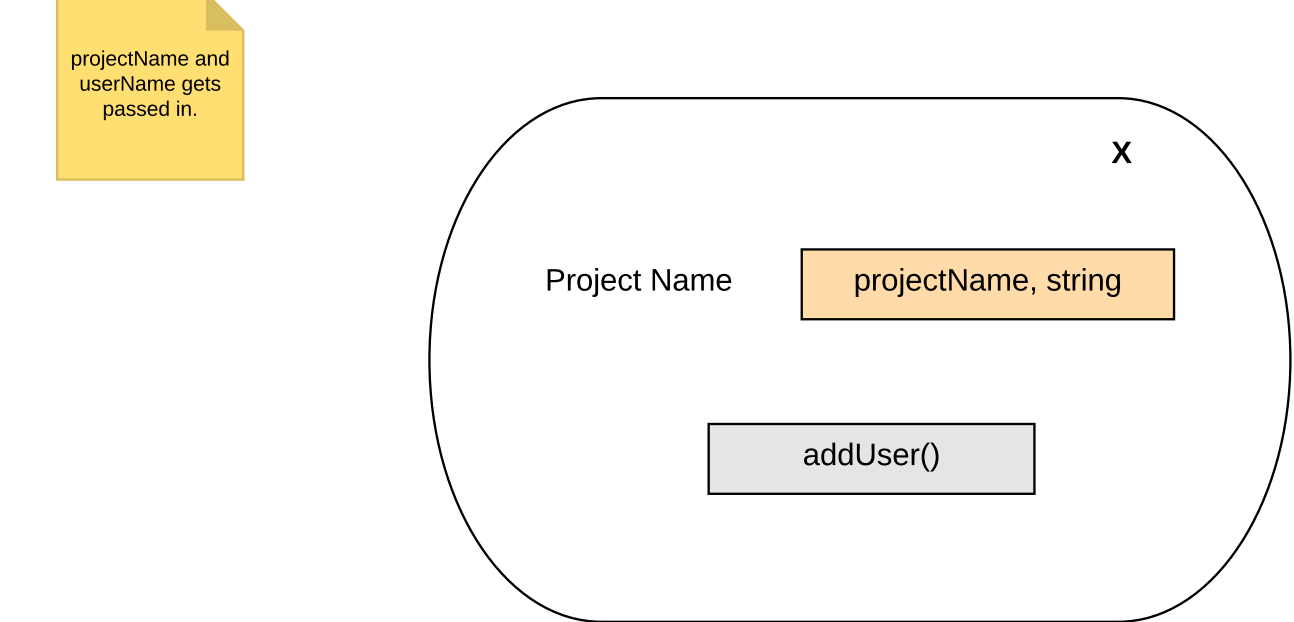

We can later edit this userName to be a function to edit user info (want to have)

createProject()

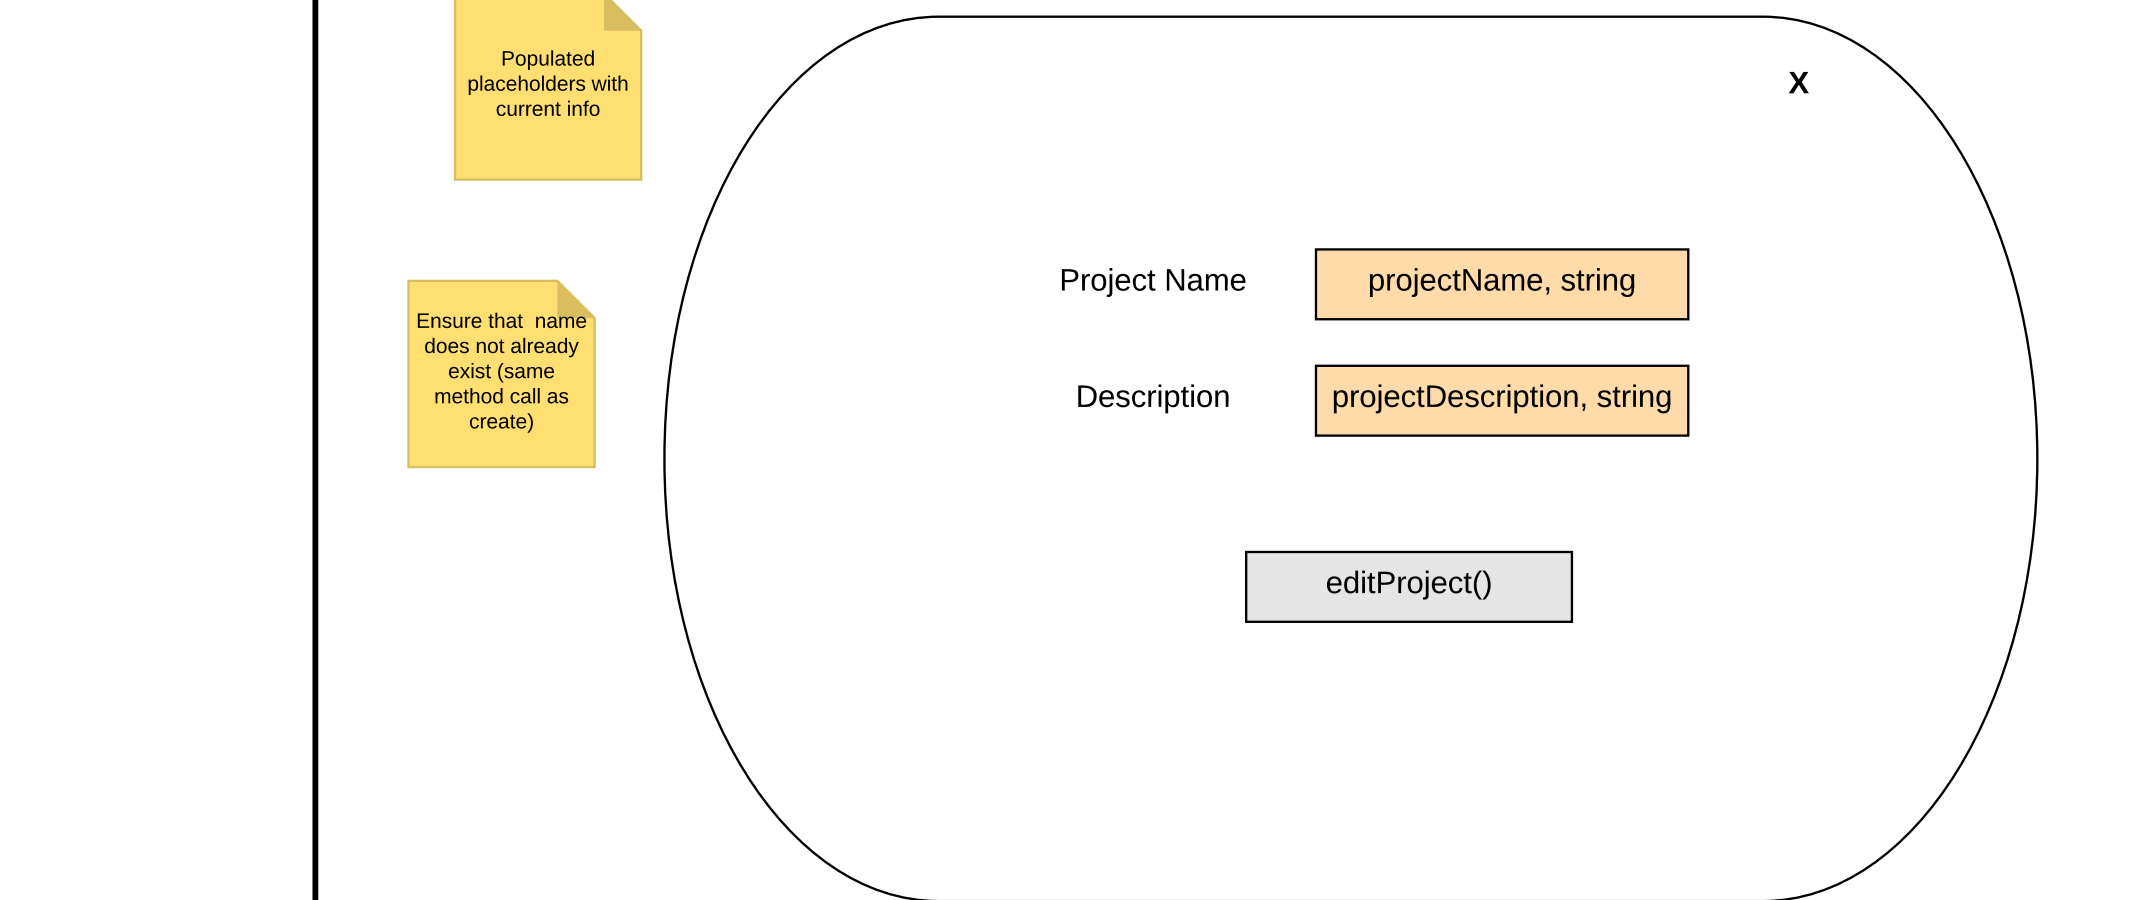

Server also needs to ensure that a username does not create a project with an already existing name

joinExistingProject

projectName and userName gets passed in.

editProject()

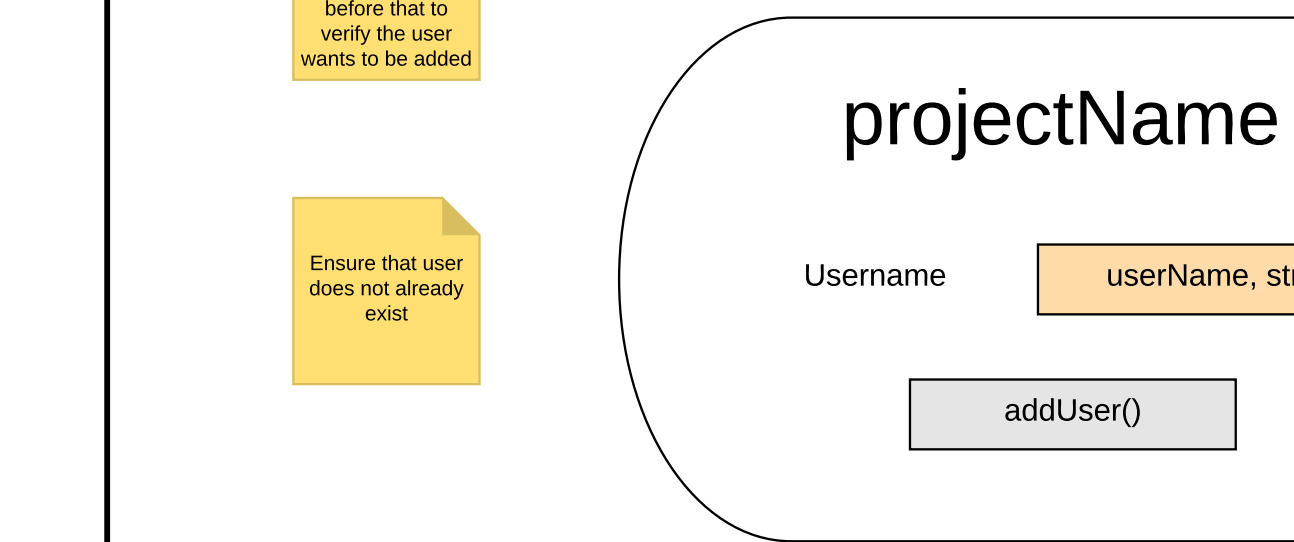

Populated placeholders with current info

Ensure that name does not already exist (same method call as create)

leaveProject()

inviteToProject()

I have this as addUser() for now, but later we have to add another function call before that to verify the user wants to be added

Ensure that user does not already exist
